DESCRIPTORS *Abstracts; Accreditation (Institutions); Adult Education; *Annotated Bibliographies; *Clinical Experience; Educational Administration; Educational Finance; Educational Programs; *Health Occupations Education; *Health Personnel; Standards

ABSTRACT

The document is the last volume of a four-part report of a study conducted to evaluate and assess the national state of clinical education and training of allied health manpower. It presents a bibliography of all significant clinical education materials, documentary materials and ongoing studies, through August 30, 1973 but after 1965. The bibliography is presented in two parts. The first part contains 434 entries for the following categories of clinical education: (1) general (health manpower characteristics and development), (2) content, (3) credentialing and standards, (4) continuing education, (5) students, (6) management, (7) resources, and (8) financing. Within each category, the entries are arranged according to the following areas: title, principal investigator(s), sponsor, publisher, data, contents, place of publication, accession number, availability, focus, methodology, coverage, and findings/conclusions. The second part contains 67 abstracts of significant materials which are arranged alphabetically by author. (EC)

****
* Documents acquired by ERIC include many informal unpublished *
* materials not available from other sources. ERIC makes every effort *
* to obtain the best copy available. Nevertheless, items of marginal *
* reproducibility are often encountered and this affects the quality *
* of the microfiche and hardcopy reproductions ERIC makes available *
* via the ERIC Document Reproduction Service (EDRS). EDRS is not *
* responsible for the quality of the original document. Reproductions *
* supplied by EDRS are the best that can be made from the original. *

BIBLIOGRAPHY

This bibliography represents a survey of all significant materials in the field through August 30, 1973.

PART A

BIBLIOGRAPHY

INTRODUCTION

INTRODUCTION

This volume of the Study of Clinical Training for Allied Health Manpower presents the results of the literature review, in two formats: bibliographic entries for all items reviewed and abstracts of significant works. Details on ongoing studies are provided in similar formats. The following discussion outlines the methodology used in identifying and reviewing pertinent materials and key features of the bibliographic formats.

1. THE BASIC STUDY FRAMEWORK WAS EXPANDED TO INCLUDE THE REVIEW OF DOCUMENTARY MATERIAL

The following six major areas of inquiry made up the basic analytic framework for the study, as discussed in Volume I:

- Management
- Financing
- Resources
- Content
- Standards and credentialing
- Students

Two additional categories were established for the documentary materials and ongoing studies that could not be classified adequately in any of the above areas.

A general category was established for materials that treated a variety of topics with equal emphasis. Studies dealing with broad characteristics of health manpower and its development were also included in this category.

Continuing education also was established as a separate category. Materials dealing with any facet of continuing education were included within this category.

2. DOCUMENTARY MATERIALS WERE SELECTED AND REVIEWED USING SEQUENTIAL SETS OF CRITERIA

Documentary materials were defined as books, monographs, conference and research reports, periodical and journal articles, and formal issuances by professional associations. These issuances included accreditation essentials, educational guidelines, and certification requirements. Doctoral dissertations and master's theses as well as copies of speeches, information updates, and press releases were also within the scope of the survey.

The steps implemented in collecting and extracting relevant materials were as follows:

- Identification and selection
- Classification and review
- Annotation and abstracting

The two methods used in the search for materials included (1) review of indexes, bibliographic resources, and special searches, as listed in Exhibit I, following this page, and (2) contacts with institutional sources or individuals, including professional associations, schools of allied health, government agencies, and persons identified by the Task Force or subcommittee members or through previous studies.

The following guidelines were observed in the identification and selection process:

- Materials prior to 1965 were outside the survey scope.
- The contents should deal with one of the eight categories.

Quarterly updates of the initial selection and identification process were carried out throughout the study. Following collection, each candidate item for the annotated bibliography was analyzed for pertinence and classified. Items were excluded from further processing if the following conditions existed:

- The material had minimal relevance or was very generalized.
- The research had been replaced by more recent extensive work.

EXHIBIT I

Division of Allied Health Manpower

STANDARD RESOURCES USED IN IDENTIFYING DOCUMENTARY MATERIALS

Indexes

- Abstract of Hospital Management Studies
- Education Index
- Educational Resources Information Center (ERIC)
- Hospital Literature Index
- Index Medicus (1966 to date)

Special mechanisms

- Science Information Exchange (Smithsonian Institution)
- National Technical Information Service
- MEDLARS

Library catalogs; including:

- National Library of Medicine
- Library of Congress
- Bureau of Health Manpower Education Library
- Department of Labor Library
- Office of Economic Opportunity Library
- Office of Education Library

A bibliographic format was completed for each item selected for inclusion in the bibliography. These annotations are found in Part A of this volume. At this time, an initial judgment was made as to the significance of each item.

After completion of the bibliographic annotations, a final selection of significant items was made within each category. Significance was judged on the following basis:

- The material was directly relevant to issue(s) identified for detailed exploration.
- The item provided relatively detailed treatment of the topic.
- The information provided was either fundamental to consideration of the subject or the source of new insights.

Abstracts were prepared for all significant items. These abstracts are presented in Part B of this volume.

3. A SLIGHTLY DIFFERENT PROCEDURE WAS USED FOR SELECTING AND REVIEWING ONGOING STUDIES

The method used to identify ongoing studies was similar to that followed for documentary materials. However, the details necessary for reviewing these studies often were not obtainable from documentary sources. Available information on these efforts therefore was considered against the criterion of apparent pertinence to clinical education.

The principal investigators for selected studies were then contacted for specific information. These contacts explored (1) details necessary to complete bibliographic entry and judge the study's significance and (2) information required to develop an abstract of the study. The information obtained through these contacts and any materials supplied was processed as previously discussed.

4. THE BIBLIOGRAPHIC FORMAT CONSISTS OF GENERALIZED AND SPECIFIC ENTRIES

The bibliographic format was designed early in the study. It was decided that this initial set of descriptors would be retained throughout the study to maintain comparability across all materials. The descriptors were therefore developed to be both comprehensive and specific. Selection of particular descriptors was governed by two criteria:

- Applicability to the general contents of a particular document or item
- Emphasis within the document

Particular entries and descriptors susceptible to differing interpretations are briefly outlined below:

(1) Entries

- Principal Investigator(s): Authors as well as study directors are identified by this entry.

- Sponsor: Organization(s) providing financial or other resources for research underlying a particular item or study. Commonly cited sponsors are abbreviated using the acronyms listed in Exhibit II, following this page.

- Publisher: Journals are cited for this entry in the case of constituent articles; as appropriate, the notation "xerox" and "mimeo" have also been included here.

- Accession No: This entry has been restricted to materials assigned such numbers by clearinghouses or documentary source centers.

- Availability: This entry describes the most generally accessible source of particular items such as a clearinghouse or, as appropriate, a specialized source such as the publisher.

- Graphics: Pages with either illustrative or tabular information were counted within this entry.

(2) Descriptors

- General indicates that the item applies to a broad range of allied health occupations or focuses on more than two occupations.

- Occupation refers to general fields within allied health on which the item concentrates, e.g., medical technology or occupational therapy rather than medical laboratory technician or occupational therapist.

- Development indicates that the item concentrates on the introduction of new or modified methods or techniques.

EXHIBIT II

Division of Allied Health Manpower

ACRONYMS FOR STUDY SPONSORS

DHEW	U.S. Department of Health, Education, and Welfare
BHME	Bureau of Health Manpower Education, currently the Bureau of Health Resources Development
CSA	Community Services Administration
HSMHA	Health Services and Mental Health Administration
NIH	National Institutes of Health
OE	Office of Education
PHS	Public Health Service
SRS	Social and Rehabilitation Service
VRA	Vocational Rehabilitation Service
DOL	Department of Labor
OEO	Office of Economic Opportunity

- Review connotes that the material treats the past and/or present status of a subject in a general fashion.
- Evaluation indicates that the item provides a detailed exploration or research of the variables associated with a subject.
- Program refers to a basic occupational education activity in its entirety.
- Requirements primarily refers to needs for manpower; it also may indicate needs for a particular approach or technique.
- Characteristics may refer to individuals or programs.
- Performance is used similarly to Characteristics.

5. THE BIBLIOGRAPHIC FORMATS ARE ARRANGED BY CATEGORIES, WHILE THE ABSTRACTS ARE ARRANGED BY AUTHOR

Part A provides bibliographic formats for all documentary materials and ongoing studies reviewed. These formats are presented in the eight categories established for the review. Within each category, entries are arranged by bibliographic rules, i.e., author, title, etc. This approach was selected because categories may not be of equal interest to all readers.

Part B presents the abstracts in conventional bibliographic organization. This approach was felt to be appropriate due to the relatively limited number of items selected for abstract.

1. GENERAL

BIBLIOGRAPHY ABSTRACT FORMAT

Title: "Urologic Assistant (Develop Two year Training Program)"

Principal Investigator(s): M. Abdallah (University of Cincinnati)

Sponsor: DHEW, PHS, NIH, BHME, Division of Allied Health Manpower

Principal Investigator(s): L. V. McDaniel

Sponsor: DHEW, SRS

Publisher: Rancho Los Amigos Hospital

Place of Publication: Downey, California

Date: Oct 68

Accession No.:

Availability:

Contents:
Text: 32 pp.
Graphics: 18 pp.
Bibliography: 3 pp.

Focus:

___ General X Occupation (specify): Physical Therapy

X Development ___ Review ___ Evaluation

___ Program X Curriculum ___ Instruction ___ Skill Development
___ Funding ___ Cost X Output and Measure

___ Multilevel ___ Baccalaureate ___ Associate
X Nondegree Entry ___ Continuing Education

___ Didactic X Practicum (clinical)

___ Faculty X Student ___ Practitioner ___ Patient
___ Association ___ Government ___ General Public

___ Planning ___ Requirements ___ Management Administration
___ Financial Administration

___ Criteria and Standards X Methods ___ Facilities
___ Materials and Equipment

___ Characteristics ___ Attitudes X Performance ___ Credentialing

___ Task Analysis ___ Occupational Analysis ___ Job Analysis

Methodology:

___ Case Study X Demonstration/Experiment
___ Literature Review ___ Modeling/Simulation
___ Research ___ Survey ___ Other (specify): ___

Coverage:

___ National ___ Regional (specify): ___
State (specify): ___
X Local (specify): Los Angeles County
___ Urban ___ Rural

Findings/Conclusions:

___ Innovation X Modification
___ Approaches ___ Roles X Means

BIBLIOGRAPHY ABSTRACT FORMAT

Bibliography: ___ pp.

ABSTRACT

The purpose of the report is to review briefly some of the acknowledged limitations, to examine some of the suggested changes in or alternative approaches to licensing now under consideration, and to recommend steps designed to resolve known shortcomings in the system.

It reflects in part discussions held between the AMA's Committee on Certification, Registration, and Licensure and the AHA's Special Committee on Licensure of Health Personnel.

Limitations of Occupational Licensure:

- Outdated as a method of assuring quality health care services
  - Below standards of Professional Associations
  - Provide no means to ensure continued competence
- Mandatory licensure laws foster a "craft union" approach to health care
- Inhibit innovation in the education and use of allied health manpower and restrict entry.
- Does not protect physician or institution from liability.

Existing or Proposed Alternatives:

- Peer certification or registration
- Institutional and independent practitioner licensing
- State medical board registration
- Increased public policy representation on licensing boards

Recommendations:

- State legislatures remove barriers to increased delegation of tasks to allied health personnel
- Study be given to the feasibility of establishing educational equivalency measures and job performance tests as alternatives to advanced educational placement and licensure
- Encourage continuing education, self-assessment, and review mechanisms

A B S T R A C T

This collection of the proceedings of the 1967 APPA-VRA Institute treats two different aspects of evaluation:

- Evaluation of the student as a means of assisting learning
- Evaluation of learning effectiveness as a means of improving educational experiences

The collection includes individual presentations, summaries of workshop discussions, and transcripts of question and answer sessions.

Evaluation of the student is treated in different ways.

Distinctive characteristics of current students are identified in terms of needs for counseling and evaluation. Counseling is analyzed as a process for instruction as well as evaluation. Principles and techniques for interviews are presented. Suggested refinements to these techniques, which were developed in the institute workshop, are also described.

Concepts and guidelines for effective learning experiences are presented as a basis for discussion of the design and implementation of curriculum evaluation. In general, the materials update earlier institutes that dealt with planning experiences in the cognitive, affective and psychomotor domains. Development of appropriate objectives is a prevailing topic. The application of learning principles is also treated in-depth; evaluation is approached generically. Requirements and subject areas for evaluation are identified. Use of the results also is discussed.

The proceedings are oriented to physical therapy education. They can provide useful guidance for educators in other occupations, however, since the principles and guidelines are generally applicable.

ABSTRACT

This report presents the results of a mail survey of participants in a program to develop instructional capabilities in clinical personnel. The purpose of the survey was to determine the effects of a 12-hour seminar on techniques of teaching for clinical supervisors. Over 80% of the respondents felt the program was outstanding or well done. Patient care also improved as a result of the program. Overall, the study results are reported to indicate that the program should be continued and expanded.

The development and content of the program are briefly treated in the introductory material.* The operation of the program is summarized in terms of enrollments, sessions and costs.

The evaluation results include the number and nature of respondents and their reactions to particular queries. Responses are tabulated for some questionnaire items; in other cases, the report discusses the results.

One area of evaluation dealt with clinical education provided by health care agencies to educational institutions. A majority of the respondents were involved in affiliations. The instructor training program had only limited impact on the effectiveness of such education. It also did not lead to any significant improvement in relations between colleges and hospitals cooperating in clinical education.

---

*Detailed description is provided in M. H. Anderson Clinical Instructor's Training Program: Training Manual (see Part A).

Bibliography: ___ pp.

ABSTRACT

This article summarizes the results of a 1967-68 mail survey of the faculty/staff of dietetic educational programs approved by the American Dietetic Association. The purpose of the survey was to support development of national and/or regional educational programs as well as recommendations for faculty/staff. The findings also were to provide a baseline for continual assessment. A detailed report of the findings in tabular and narrative format was distributed to the Dietetic Internship Council.

Four basic tables are discussed in the article, including:

- Educational experience and association membership
- Job categories by percent of workweek
- Work history
- Professional activities, including education

The findings are summarized and recommendations presented. The summary highlights a variety of characteristics of both internship program and faculty/staff. These characteristics include the following:

- Size of programs
- Age of faculty/staff

- Multiple job activities
- Limited number of advanced degrees

The recommendations focus on the high proportion of young, mobile faculty/staff in dietetic educational programs. The large amount of staff level involvement is also cited. Three different types of educational activities are recommended, including an annual program on educational methods and practices. It is suggested that planning recognize the difficulties that younger staff members may have in attending the programs. Investigation of methods to encourage attendance and strengthening of educational backgrounds also is recommended.

ABSTRACT

This article analyzes the following "teaching innovations:"

- Teaching aids
- Dynamic projection of polygraph recordings
- Closed circuit television
- Videotapes

A short history of the development and use of each aid is provided. The advantages and disadvantages of each are described. Availability and alternative ways to overcome the disadvantages are discussed.

The paper concludes that these media should be used more widely than they are. In general, these aids provide a means to accomplish the following:

- Resolve patient availability problems
- Compress time in studying the chronically ill
- Reduce distance between the basic science laboratory and the clinic

ABSTRACT

This article describes and analyzes a project to provide out-of-hospital clinical experience to physical therapy students at Stanford University. The clinical education was provided in cooperation with the county Visiting Nursing Service. The community-based experience operated in both the preinternship and the internship portion of the program. It was accompanied by curriculum changes that emphasized total patient care "as opposed to selective care in certain kinds of patient settings."

The analysis examined:

- Clinical experiences in terms of disabilities encountered, methods of treatment used, and related professional activities
- Patient care information
- Work experience following graduation through a followup questionnaire focusing on place of employment and project participant involvement in functions related to out-of-hospital care

The analysis data are presented in 10 summary tables. The narrative expands on important related findings.

In summary, these data are described as a baseline for curriculum planning by other programs. They highlight the student learning experiences that can be provided in a home care program. They also indicate the need for coordination between clinical facilities to provide accumulative rather than repetitive clinical education. Finally, the project resulted in increased participation by graduates in out-of-hospital situations.

ABSTRACT

This article is primarily concerned with the graduate student. As noted by the author, however, "the findings are applicable to other levels of occupational therapy."

Two assumptions are basic to the study:

- Stress is inherent in professional education.
- Occupational therapy is a vocation moving along a continuation of education.

The components of student role stress are described in terms of current theories in behavorial science and social psychology. Overall approaches to alleviating student stress are also discussed. Above specifics are provided by a brief review of an empirical study conducted by the author.

The study of role stress experienced by occupational therapy students found that stress occurred in both academic and clinical environments. Ambiguity and conflict were major factors. The kind of stress differed somewhat and indicated a relatively rare reaction in the clinical students. Their morale was lower than that of academic students. These results appear to indicate the need for special guidance of the student on clinical affiliation Student comments supported and extended this conlusion to particular areas of need.

Date: Feb 70 **Contents:**

Place of Publication: **Text:** 4 pp.
Accession No.: **Graphics:** ___ pp.
Availability: **Bibliography:** ___ pp.

ABSTRACT

This article presents the results of a study of the effectiveness of audio-tutorial independent study in an undergraduate physical therapy curriculum. A multimedia programmed approach was developed and used to present the theory of goniometry and associated technical procedures. The instructional materials, the 40 student subjects, and the study process are described.

Both the experimental and control groups--students taught in the conventional lecture-demonstration method--were tested through a practical examination and a written multiple choice test.

The groups were compared on:

- Accuracy of measurement in the practical examination
- Adequacy of clinical technique
- Written test scores
- Numbers of hours spent studying goniometry

The performance of the two groups did not differ significantly. The audio-tutorial approach was found to be equally effective as the conventional approach. More importantly, the learning time of the experimental group was significantly reduced. The members spent an average of 8.39 hours in independent study. This time was almost equivalent to class time for the student taught by the conventional approach. The audio-tutorial method was also found to support small group sessions with patients. As a result, congestion in the clinical setting is reduced.

ABSTRACT

This study presents a comparison of continuing education programs in northern and southern California. A survey was made of 25 respondents in the northern part of the State and 18 respondents in the southern portion. An open-ended questionnaire was administered in a one-hour interview to each respondent selected through random sampling.

It was found that less interest and positive support exists for continuing education in northern California than in southern areas as reflected in:

- Fewer formal staff training programs.
- Fewer agencies considered inservice training and continuing education as a factor in promotion.
- More criticism of course presentation
  - Quality of presentation
  - Lack of practical experience of faculty

Other differences between the two regions included:

- Time allowed away from job
- Preferred length of training periods
- Travel limitations

- Financial support
- Methods of advising and selecting participants

ABSTRACT

The story of Philadelphia's changing health system is really the story of how an imaginative and talented official in the new state administration is using new tools and a new style to force changes in a defective system. This candid account outlines what has been proposed, what has been implemented, and what the early results are. In addition, it offers some valuable tips for those who have a genuine interest in bringing about change in the health delivery system and the health management production effort. For those who someday may find themselves in a set of circumstances similar to the Philadelphia experience, the author urges a positive, receptive attitude. He goes on to recommend various courses of action that should be considered in order to be responsive to the forces of change and to avert the destruction of a system that has the ability to deliver and serve people.

ABSTRACT

This article provides a review of the underlying theories of programmed instruction, its contributions and drawbacks, and recommendations for maximizing its use. The purpose is to warn dietitians of certain dangers they will encounter as they work with programmed instruction and to suggest certain opportunities that programmed instruction will provide.

The article suggests that PI can be defined best in terms of possessing three characteristics:

- Instructional material is presented in steps.
- The student must participate and respond at each step.
- Some feedback is received for each response.

The recommendations for using programmed instruction are presented against the context of present status and probable future development. Eleven ways to capitalize on advantages are outlined. Highlights of these suggestions include the following:

- Ensure that someone who is thoroughly familiar with PI is involved in any development project and work to improve user familiarity, both instructor and student.
- Base all development efforts on a careful definition of objectives, student involvement, and careful testing.
- Use experts with careful direction encouraging imagination and insisting on attention to motivational effect.
- Include a definition of the intended user with every program.

ABSTRACT

The overall purpose of this manual is to promote a consistent approach to student clinical education. At the same time, the necessity of capitalizing on individual strengths of different centers is highlighted. The manual therefore provides "... suggestions on which a .... sound and locally conditioned program of student affiliation may be devised."

As a tool and reference for the clinical supervisor, the manual is designed to accommodate updates and additions to materials. It consists of seven sections and a set of the Association-designed forms for clinical affiliations. The sections treat the following aspects of clinical education:

- General policies and procedures for clinical affiliations in occupational therapy
- Orientation of the student to the affiliation
- Treatment program from the viewpoint of the student's role and participation
- Guidance of the student from orientation and planning of the individual affiliation to final evaluation of the student

Other sections discuss the role, structures and functions of the Association Committee on Basic Professional Education and the local clinical council. These councils are established for each occupational therapy program and its affiliation centers. A bibliography is also provided.

The manual emphasizes the need for careful planning of clinical learning experiences considering the discipline, the student, the patient and the setting. The importance and benefits of regular counseling and evaluation adapted to the student's needs are stressed.

ABSTRACT

This article is primarily an analysis of institutional and allied health curricula growth in junior and community colleges stimulated by grants under the Basic Improvement Section of the Allied Health Professions Act of 1966. A review of other studies of allied health education at the associate degree level is also presented. This review supports the author's conclusion that junior and community colleges are a major force in basic occupational preparation in terms of numbers of programs.

Growth in programs funded under the act is analyzed on the basis of fiscal year awards. The time span covers fiscal years 1967 through 1970. Awards are categorized by recipient institution, occupational program, and degree. Details of growth during the period of interest included the following:

- Funded senior college training centers, as defined under the act, increased by 38% (164 to 277 institutions) while junior college centers grew by 165% (28 to 75 institutions).
- Funded baccalaureate curricula increased 31.5% while those at the associate degree level increased by 141%.

ABSTRACT

This report provides a general assessment of the status of audio and audio-visual materials in the education of health science personnel. Limitations affecting use are discussed, as are suggestions for expanding the role of these materials in basic occupational preparation and continuing education.

A description of the types of audio and audio-visual materials historically used in the education of health science personnel introduces the discussion of problems. The introductory discussion also indicates the applications of these materials. Details on uses and users also are interjected throughout the review of current limitations on realizing the benefits of audio and audio-visual materials. In addition, the emerging importance of Learning Research Centers is highlighted.

The author highlights the following limitations on more extensive use of audio and audio-visual materials:

- Tendency of institutions to be exclusive in their development and use
- Inadequate information exchange on available materials due to
  - Difficulties of developing meaningful exchange mechanisms

  - Lack of concentrated organized efforts to provide for such exchange although noteworthy recent exceptions to this tendency are discussed

- Difficulties in arranging access to available materials

- Variations in types of supporting equipment

The suggestions for improvement are directed to actions by individual institutions and a coordinating organization. The report suggests that regional centers be established with the following responsibilities:

- Identification and description of existing materials

- Establishment of mechanisms to provide the above information to potential institutional users as well as interested local organizations

- Survey of needs for additional development based on rigorous examination of educational program objectives and institutional capabilities

- Development of needed materials and/or coordination of such efforts

- Planning and provision of support to facilitate exchange of audio and audio-visual materials including identification of compatible equipment and technical assistance

ABSTRACT

"This book is designed to assist the student in developing a frame of reference of clinical education, to acquaint him with the objectives of various clinical experiences, and to help him in his development as a person, as well as an occupational therapist."

The book provides the reader with information about clinical training in the following areas:

- Principles of clinical education
  - Principles and general objectives
  - Assignments
  - Training Centers
- Orientation to clinical education
  - Frame of reference
  - Pre-clinical program
  - Clerkship programs
  - Clinical field work
- Selected aspects of clinical education
  - Supervision
  - Student growth
  - Patient care

Evaluation of clinical education

- Program evaluation
- Evaluation of learning experience
- Student evaluation
- Attitudes about evaluation

The book also contains a glossary of clinical education terms.

ABSTRACT

This paper sets in perspective the evolution of accreditation trends in the United States, and considers present concerns about accreditation. The authors examine the impact of social change on accreditation, ways professions have influenced educational program and institutions through accreditation procedures, the influence of the courts on the role of accrediting agencies in society, and Federal involvement in accreditation. The conclusions include that, unless accrediting agencies are able to reinvigorate the accrediting process, with emphasis on national welfare, the public could insist on other means of external monitoring of higher education.

ABSTRACT

"A method for analyzing the work in a department of physical therapy was devised and applied in a teaching hospital. Physical therapists, trained as oberver-investigators, helped refine the coding system and were able to reliably record job behavior in the physical therapy department. The nature of therapist's and aide's job was described and implications for physical therapy practice and academic preparation drawn. Therapists' judgments provided a basis for describing tasks which might readily be incorporated into the work of a trained physical therapy assistant."

Title: Hartford Hospital Study of the Cost of Education Programs

Principal Investigator(s): Ernst & Ernst

Sponsor: Hartford Hospital

Publisher: Hartford Hospital

Date: 1972

Place of Publication:
Accession No.:
Availability:

Contents:
Text: 48 pp.
Graphics: 9 pp.
Bibliography: ___ pp.

ABSTRACT

This report presents the results of a study done to determine the net cost of education programs at Hartford Hospital.

In determining the total present cost of the programs, costs were divided into three classifications:

- Costs charged directly to a program and which would cease if the individual program were abolished.
- Costs which would remain substantially unchanged if any one program were abolished, but which would significantly disappear if most programs were abolished.
- Costs which would remain substantially unchanged if all or most programs were abolished.

In addition to determining the costs, certain income or credits were attributed to the programs. These included student payments and external funds received because programs were conducted. These credits were applied to the gross cost to determine the net cost of educational programs.

The study also determined the value and amount of patient care services provided by the students in the different programs. This value was determined to be the cost the Hospital would have to incur in order to maintain the present level of patient care and community service if the educational program were discontinued. The costs, credits and replacement value of the education program were then compared to arrive at the net theoretical cost of the education program.

The findings of the study revealed that the Hospital would have had an increase of $9,099 in total operating costs in fiscal year 1971, if they had discontinued all educational programs prior to the beginning of the fiscal year.

ABSTRACT

This paper begins by briefly comparing and contrasting official licensure and non-governmental accreditation and certification.

The paper then focuses on several aspects of licensure laws and what affects they have on health personnel and facilities. The issues discussed are:

- The adequacy of current minimal mandatory standards
- The effect of present licensure laws on innovations in education of physicians and other health personnel
- The relation of licensure law to the ways that critically scarce personnel are used to provide high-quality health care
- The intent and research of current statutory provisions for licensure of facilities

The paper discusses the possible solution of merging the two systems and the problems and benefits involved in doing so.

ABSTRACT

"This report describes the overall work of the Health Services Mobility Study and the first ten months of its current demonstration phase (Phase IV). It is addressed to the reader who wants to know about the overall objectives of the Health Services Mobility Study, what it has done, its current work, and its future plans."

The project was designed to review the structure of occupations in health services and to find what obstacles exist to upward mobility.

During Phase I of the study several observations were made and conclusions drawn on the current state of the health manpower field. Some of these are:

- Artificial institutional and educational barriers have, up to the present, inhibited the upward mobility possible in the field of health manpower.
- Entry into the health field has been increasingly hedged with credential barriers such as licensure or certification requirements.
- The developments in education have seen a proliferation of credentialed health care curricula which overlap and duplicate requirements.
- The greatest social cost in health services lies in the education and training of health manpower, due to improper allocation of function to personnel, and in the redundancy of training requirements.

The overall objective of the HSMS is to create the basic methodologies that would make possible the design of job ladders, curriculum ladders, and performance evaluation instruments that would be practical and implementable.

Chapter 1 provides an overview of the project's history and objectives.

Chapter 2 is devoted to a description of the work methodology.

Chapter 3 summarizes the steps taken in applying the methodologies in task analysis and curriculum design.

Chapter 4 describes the work of the project that deals with the implementation of the research results. It also covers the plans to disseminate the results.

ABSTRACT

This is a report on the first pilot test of the Health Services Mobility Study's (HSMS) method of job analysis.

Two sets of results are presented, the first indicating that the methodology can be applied and "works" and a second set based on the specific content of the test data.

The Health Services Mobility Study sought to minimize educational resources through the utilization of prior knowledge and experience, and thus allowing upward mobility for individuals by utilizing the skill and knowledge links between task and jobs. The creation of such a methodology would make possible the elimination of shortages through the utilization of existing manpower.

The HSMS system of job analysis has four components. These are:

- Task identification
- Identification and rating of each task on 16 skill scales
- Identification and rating of the knowledge needed for each task
- Statistical manipulation of the task data so as to identify the interrelated skills and knowledge categories and then to identify task sequence based on the families of interrelated skills and knowledges

From these results job ladders are designed.

The pilot test was conducted at one site, and the design included the tasks of 13 individuals in as many titles.

ABSTRACT

This report presents the findings and conclusions of a study done to analyze those tasks which are performed by various levels of personnel within a medical record department and to determine the components of curriculum.

In conducting the study, the following procedures were employed:

- Search of pertinent literature
- Search of a national committee of leaders in the medical record field who would guide, assist, and validate the development of curricula and instructional materials
- Surveys

The findings reveal that current practice in medical record departments is at variance with practices recommended by the National Technical Advisory Committee. Survey results revealed no discernible relationship between criticality, difficulty, and technical knowledge. The survey also showed that twenty-five percent of respondents had no previous training before entering employment in the medical record department.

ABSTRACT

This monograph discusses allied health education in the South and presents some recommendations and predictions for its future.

The author begins by briefly describing the present environment surrounding the allied health professions and its impact on the educational system.

Following is a discussion of the present situation and expectations for the future in the following allied health disciplines:

- The clinical laboratory
- Radiologic allied health
- Respiratory therapy
- Health records
- Health education
- Nutrition
- The emerging professions

The following section presents some predictions as to the future of allied health education and, based on these forecasts, some recommendations for the future.

These recommendations include the following:

- Programs should be located in institutions where they can realize their potential.
- The type and geographical location of allied health programs must be determined by regional need for personnel, not local.
- An objective and responsible authority needs to be developed to monitor the establishment of programs in allied health.

ABSTRACT

This article reports the results of a pilot study to test the hypothesis that personnel of physical therapy departments are well prepared for their jobs. Interviews were conducted with physical therapy aides and therapists working at three levels of responsibilities in different facilities. Differential levels of preparedness were found with numerous implications for basic and continuing education as well as for personnel selection.

The study results indicate that large numbers of physical therapists at all levels of job responsibility are required to teach and supervise to some degree. Chiefs, assistant chiefs, and supervisors were found to be spending more time in administration and related activities than in patient treatment. At the same time, not one therapist interviewed felt that she had received adequate instruction for effective execution of these duties in their formal physical therapy education.

Opportunities to develop necessary skills were described as meager.

The author concludes that a need exists for formal courses on supervision and administration in undergraduate curricula in physical therapy.

ABSTRACT

This article outlines and explains a program which correlates theory and technical methods and uses learning experiences in a teaching laboratory to increase efficiency in medical technology education. The program is designed for use in either a large or small school. It is based on experimentation with 15 classes of students to develop more effective methods of presenting information, to cultivate imagination and independent thought, and to stimulate use of literature and investigative ability.

The article discusses the principles underlying the program, the correlation of lecture and laboratory experiences and resource requirements including those for personnel, equipment, physical facilities and finances.

The most effective daily program was found to consist of two one-hour class sessions, four hours of student laboratory, and two hours of correlated laboratory experience.

No new techniques are taught in the correlated laboratory experience in the operational setting--this is seen to be the responsibility of the educational program. In the student laboratory, emphasis is placed on:

- Correlation with the classroom material
- Efficient learning experiences, eliminating needless repetition
- Methods for quality control

- Effects of variation of technique
- Developing ability to experiment, acquire data, and form logical conclusions.

Tuition is considered essential. Increased student capacity is cited as one advantage of the program; other benefits to students, instructors, and the program also are noted.

ABSTRACT

The focus of this summary report is noncredit courses designed to improve job skills and up-grade job performance and/or job level. A number of mechanisms were used in performing the study, including the following:

- Review of the literature
- Three surveys, namely:
  - A mail questionnaire of hospitals stratified by size and geographic region to explore awareness and use of correspondence courses
  - A mail questionnaire sent to hospital administrators designed to explore hospital educational policies related to correspondence education
  - In-depth interviews with administrators and department heads in 30 hospitals
- A panel of 25 experts knowledgeable in the field of correspondence education

The report summarizes the study's findings into seven areas:

- Applicability of correspondence instruction as an educational method

- Hospital awareness and usage
- Hospital policies relating to correspondence instruction
- Hospital personnel's ranking of training needs and interest in meeting these needs through correspondence courses
- Evaluation of specific courses
- Expert opinions on types of courses

The overall recommendation is that a central agency be established to focus its attention on correspondence for hospital personnel in view of its apparent potential and the general lack of awareness among hospitals of that potential. Ten functions are identified for the center.

ABSTRACT

This article reports a survey of 165 senior students and 122 sophomore students in medical technology programs sponsored by three major universities. The survey was conducted over a two-year period to ascertain the following:

- Attitudes toward education in medical technology
- Reactions to clinical practicum
- Concepts of medical technology as a profession

Details of the methodology and results are provided.

On the whole, both sophomore and seniors responded positively toward their total education although their reasons for dissatisfaction focused on their desire for earlier contact with the laboratory. The internship experience was the major factor in senior feelings of dissatisfaction and/or discouragement. Comments quoted to illustrate these feelings included the following:

- "Rather than trying to teach students as much as they can, they seem to try to see how much free work they can get out of the student. Rather than creating a friendly atmosphere for the student to learn in, they seem to try to make it as stilted as they can, making the student feel like he is a pest of some kind, who can't do anything right. I wounder how a student is supposed to gain confidence in his work and pride in his profession when he is received with this attitude."

> "I think too much depends on your personality as far as student evaluation is concerned."

Conversely, a satisfied senior commented that: "The clinical year has finally made our previous education pertinent."

ABSTRACT

This article discusses the development, revision and use of an instrument to evaluate junior and senior students' performance in clinical practicum. The instrument was developed by the clinical coordinator and faculty of the Department of Physical Therapy at Temple University with assistance from clinical supervisors. It has been found to provide valuable data on the strengths and weaknesses of students, clinical programs, and didactic courses during a three-year trial period.

The evaluation instrument has two dimensions:

- Behavioral objectives stated in terms of the visible activities that the student is expected to display in the areas of treatment skills, specific techniques and administrative and supervisory practices
- A rating scale based on the following criteria relative to the amount of required supervisor direction:
  - Student fails to meet the objective.
  - Student is unable to fulfill objective without assistance.
  - Student requires supervision and occasional assistance when fulfilling the objective.

- Student demonstrates skill when fulfilling objective, but requires occasional supervision.
- Student demonstrates skill when fulfilling objective with only guidance.
- No opportunity to observe

The major problem involved training clinical personnel in proper use of the instrument. It is intended primarily as a diagnostic tool and only secondarily as a means of determining grades.

The tendency of clinical supervisors to interpret the rating scale in terms of grades 5=A=Excellent, rather than in terms of the criteria, is occasionally apparent. As the supervisors become more familiar and comfortable with the criteria concept, the tendency to "grade" decreases.

ABSTRACT

This article discusses job restructuring and ways in which it may be done. The article defines restructuring as "the changing or rearranging of job content in terms of the tasks performed in a job or group of jobs in order to utilize available labor supply, increase production, or satisfy technological requirements."

The article discusses the following broad approaches used in designing jobs:

- Process-centered
- Worker-centered
- Combination process-worker-centered
- Job-centered

It also gives a brief description of three broad categories of job designs:

- Individual
- Line specialty
- Line rotation

A brief discussion of techniques developed for analyzing jobs in terms of worker functions and worker traits is also provided.

The article ends with a discussion of three directions restructuring can take and the situations each is best suited for. The three directions are:

- Horizontal
- Vertical
- Diagonal

ABSTRACT

This presentation primarily focuses on a "total concept of education" that should be provided to laboratory personnel. The proposed concept is directed to achieving knowledgeable competency throughout a laboratory. Such competency underlies the need for the association to reexamine its composition as an avenue to upward mobility.

The author contends that occupational competency--a major goal--should be a "happy union" of theory and skill. At the same time, he urges that the curriculum include course material that will promote personal and professional advancement. Such material should be transferable to the extent possible. At the same time, students and educators should realize that basic occupational routes to different levels vary necessarily. As long as unnecessary barriers are not introduced, these differences and the associated requirements should not be considered a weakness of the educational system. Barriers can be avoided by involving educators at different levels in curriculum development.

The article also proposes "... that the hospital laboratory be denied the student unless it can be proven to be worthy of inclusion in the curriculum." The author does not suggest automatic exclusion of clinical experience. Rather, program developers should examine carefully the ability of available health care agencies to provide meaningful learning experiences. If sufficient space, staff, and other resources cannot be provided, a simulated clinical laboratory should be developed on the college campus. In this way, the teaching environment and learning experiences can be controlled to ensure that education does not interfere with patient care or vice versa.

ABSTRACT

This paper reports on the results of a series of studies on the use of self-instructional programs and materials in educating doctors, nurses and patients as well as allied health personnel. The research program was begun in 1962 at the University of Rochester.

The major conclusions derived from three different studies were as follows:

- Programmed materials would be received positively by health practitioners.
- Informed their colleagues of innovation and enabled them to utilize new techniques. In general, they found that health educators are capable of developing sound instructional material.
- The level of achievement using programmed as compared to conventional instruction forms of continuing education teaching was found to be superior.

ABSTRACT

The article discusses the lack of, and/or need for:

- A national health system
- The ability to accept and implement change rapidly
- A reduction in the proliferation of health occupations and terminology which are essentially repetitive
- Further delegation of duties and responsibilities to others
- Clearly defined national and local objectives for health care programs
- Optional staffing patterns and ratios of auxiliary to primary personnel

The article also discusses some of the new concepts of delivery of health care and how these will affect the allied health professions. Some of the areas mentioned in relation to these changes are:

- A competency-based curriculum
- Challenge examinations
- Credentialing and the determiniation of its future role

ABSTRACT

This article summarizes the results of a survey of the 10 physical therapist assistant programs with students enrolled during the 1968-70 academic years. The survey was conducted to develop data on the following characteristics of programs:

- Methods of curricular organization
- Instructional techniques
- Patterns of organizing and integrating subject matter concepts

The results are presented in a series of tables and narrative discussion.

In general, little uniformity existed with respect to number of courses, hours of didactic and clinical instruction, or sequence of instruction. Total time for clinical practice covered a range of 241 to 699 with a 505-hour median. Six programs scheduled clinical practice beginning in the first semester or quarter of the student's enrollment. Different amounts of clinical practice were scheduled during one (first) or both years in addition to a block of 320-440 hours during the summer ending three programs. Laboratory instruction was the preferred method of didactic instruction. A majority of programs used programmed and self-instructional materials, although with substantially less frequency. Only one institution used role playing. Simulated clinical experience was used with secondary frequency in another program.

ABSTRACT

The study reported in this article compares student performance during an occupational therapy assistant course with subsequent on-the-job performance. This study was designed to provide health facility administrators with guides for selecting employees to enroll in the course at their expense. The variables investigated included clinical experience grade, academic test grade, prior experience as an occupational therapy aide, and prior years of schooling.

Performance in practical experience as reflected in the grade was found to be a small but definite predictor of job performance. Grades received for the theoretical phase also predict job performance but not with as high correlation. These grades demonstrated a significant relationship.

Prior job experience is correlated highly with grades for both phases of the program. Its relationship to subsequent job performance is positive but minimal. Years of schooling prior to the program did not relate to job performance and only had a low correlation with the theoretical phase. These results were reported to indicate that prior job experience should be a factor in student selection.

ABSTRACT

This report presents the results of a project to develop a curriculum for a medical laboratory technology program. The report contains an evaluation of [illegible] present medical laboratory technology program by the committee and presents the committee's new program proposal. The report contains two sample programs developed by the committee.

These programs are designed to have more flexibility than the present program. They also incorporate the block concept of study, thus eliminating the traditional time-oriented sequencing of training. Suggested curriculum content of the different blocks is presented as well as suggestions as to the emphasis to be placed on activities (knowledge and skill development vs. skill application).

ABSTRACT

This report is one of a series prepared by the Education for Health Care Project under the auspices of the Michigan State Board of Education. It provides general recommendations on health education planning. In addition, major recommendations are summarized for each of the 26 health care manpower groups studied.

Brief analyses of all manpower fields are provided. In each case, these summaries discuss the functions and characteristics of the occupational grouping. Characteristics include numbers, nature of employment and state and national credentialing provisions. Educational programming is described from the viewpoint of current situation and developments in Michigan as well as national trends. Recommendations as to improvement and expansion of programs are then provided for each occupation.

The general recommendations are of major interest from the viewpoint of planning and coordinated management of health manpower education. The 15 points set out a framework for complementary state and institutional action. The framework provides for improved institutional relationships within the educational system and between the system and health care agencies. Trends associated with the requirements of the learning process and of students are explicitly recognized. Also recognized is the need to focus management responsibility for particular activities such as articulation, clinical education, and evaluation. Periodic evaluation is recommended for programs, institutions and health manpower in general.

ABSTRACT

This article describes a special teaching program developed by the authors with the collaboration of colleagues in the Clinical Chemistry Section of the center laboratory. The program is designed to enhance the practicum instruction provided by medical technologists despite the press of other activities and minimal training in education.

The two primary components of the program are:

- Initial intensive interaction between instructing technologist and student with gradually decreasing dependence as the student proceeds to work independently
- A series of Mechanism Charts which the technologists uses to communicate in diagrammatic form the basic concepts and principles of each procedure to be learned.
    - Physiological synopsis showing the source, focal point, and metabolic pathway of the compound in question.
    - Clinical synopsis with the range of normal values and the alterations in various disease states
    - Chemical synopsis, which is a flow chart of the steps involved in any procedure in analytical chemistry

The article describes the details of the program, including the conditions necessary to successful implementation. Its effectiveness is also discussed.

Title: The Profession of Dietetics (The Report of the Study Commission on Dietetics)

Principal Investigator(s): John S. Millis, Chairman, Study Commission on Dietetics

Sponsor: The American Dietetic Association

Publisher:

Date: 1972

Place of Publication: Chicago, Illinois

Accession No.:

Availability: Publisher

Contents:

Text: 105 pp.

Graphics: 5 pp.

Bibliography: ___ pp.

ABSTRACT

This report presents the findings and recommendations of the Study Commission on all aspects of dietetic practice, education, and professional organization.

The report covers the following areas:

- Definition of dietitians and their role in health care
- The current education of dietitians and education of future dietitians --an optional educational program
- The effect of change upon dietitians
- Numbers and kinds of dietitians required in the future
- Responsibilities of a profession
- The American Dietetic Association

The major findings of the Commission were:

- "The dietitian is a 'translator' of the science of nutrition into the skill of furnishing optional nourishment to people."
- "The current system of educating and training dietitians is deficient in several important ways."

- "...dietetic practice in the future will be altered in six ways."

The major recommendations, summarized below, are:

- "Basic education of dietitians be designed as a four-year curriculum resulting in a bachelor's degree and including both the didactic learning and introductory clinical experience necessary for beginning practice as a dietitian."
- "The undergraduate curriculum be built around the central theme of the Human Life Cycle."
- "The condition of membership in the American Dietetic Association be as open and voluntary as possible."
- "The American Dietetic Association assume responsibility for the warranty of the competence of professional dietitians in two ways, namely, by registry and by certification."
- "The American Dietetic Association not undertake at this time any direct responsibility for accrediting educational institutions in dietetics per se."
- "The American Dietetic Association operate through four councils to be known as:
    - The Council on Dietetic Practice
    - The Council on Dietetic Education
    - The Council on Dietetic Research
    - The Council on Communication "

Bibliography: ___ pp.

ABSTRACT

This article reviews and summarizes the situations that may have legal implications for an allied health student on a clinical affiliation. These implications are discussed in terms of legal trends and actual and possible results to the student, the affiliating health care agency, and the institution sponsoring the education program. Pertinent legal cases are reviewed, as are associated trends in program organization and operation.

Summary findings include the following:

- All parties in clinical education, including students, should be made aware of their legal status and how it may change.
- The parent university or school bears ultimate responsibility for its students when they are on clinical affiliation.
- The student is held to the standard of the competent professional in the specialty in the performance of his duties.
- The clinical supervisor, faculty member, or referring physician can be held legally accountable only for activities in direct supervision of the student.
- Increased liability of affiliating heath care agencies will result from the trend in legislative actions and judicial decisions to diminish governmental and charitable immunity.

- Students may be classified legally as employees of the agency although they do not receive monetary compensation. They are thereby beneficiaries of the institution's insurance coverage for purposes of liability and workmen's compensation.

- All students, clinical and academic faculty, and professional staff should have personal liability insurance.

ABSTRACT

This book is based on the following premises:

- Educational institutions and health care agencies are, or should be, partners in many activities, including education.
- The partners need a clear understanding of their respective roles, responsibilities, and functions to operate effective practical experience, or clinical education, for allied health education.
- Written agreements provide an effective mechanism for clarifying the partners' contributions and assisting in their realization.

It outlines the background and use of written agreements in inter-institutional affiliations, primarily based on physical therapy programs' experience. The form and function of such agreements are then outlined within an interdisciplinary context. Guidelines for the development of written agreements follow a discussion of the reasons they will become increasingly important.

The research underlying this publication was conducted in three stages. A survey was conducted of all approved physical therapy programs and selected clinical supervisors and faculty. Information was collected on the use of written agreements, their content, adequacy and importance. After analysis of the returns, a workshop was held to explore current practices and concerns in depth. A concurrent activity was an extensive literature search.

The book provides a useful tool for all institutions engaged in clinical education. It presents the following elements helpful to developing interinstitutional arrangements:

- Definition of a contract
- Profile of a contract
- Minimum essentials of an affiliation agreement
- Basic steps in drafting agreement
- Authorization

The guidelines are structured as major alternatives for consideration by both parties to the contract. Development of clearly defined objectives for the partners is a basic consideration. They also highlight factors associated with the rights, responsibilities and obligations of the university and the clinical center and those that may be joint. Finally mechanisms for continued cooperation, regulation, review or termination are discussed.

ABSTRACT

The Advisory Council is the only Federal Government organization with statutory authority to oversee the extensive and diversified Federal effort in extension and continuing education and community service. It is required to report to the President on the administration and effectiveness of all Federal programs in these areas--the genesis for this study.

The study was accomplished in three stages:

- All Federal programs with a community service, extension, or continuing education component involving insitutions of higher education were identified, and written descriptions were prepared.
- Case studies were made of programs that constituted major areas of Federal support.
- A broad assessment was completed of the Federal effort in extension and continuing education as well as community service drawing on the information developed in the first two stages.

The report presents a summary of major findings and discussions of seven primary issues in Federal support of extension and continuing education. It also includes the case studies of nine programs including Regional Medical Programs. A series of seven recommendations are set forth including a proposal for enactment of a higher continuing education act that would provide for greater emphasis on:

- Counseling for continuing education
- Support for individual students
- Individualized instruction

Finally, the report outlines the activities that the council proposes to undertake in support of its recommendations.

Although allied health manpower is not singled out for attention, the difficulties cited have bearing on any type of continuing education. These difficulties include:

- Coordination between educational institutions and employers
- Funding
- Design of efficient and effective programs
- Identification and fulfillment of the educational and other needs of students

In addition, the case study of RMP highlights a number of issues that have yet to be resolved regarding continuing education for all health manpower.

ABSTRACT

This summary report outlines briefly the results of a study of the present role of equivalency and proficiency testing in the medical laboratory field, in related health fields, and in other fields where experiences are applicable to the laboratory. The study points up the need for equivalency examinations in the field and the present interest in and receptivity to the idea of equivalency among the professions and the educators.

The study includes a review of available literature in the general field of pyschological testing, in educational testing including testing for academic credit, and in testing in the health occupations. An annotated bibliography is included in the full report.

Contacts were made by letter, telephone, and personal interview. Those people contacted included:

- Representatives of organizations in the health professions
- Staff members of testing agencies
- Laboratory directors
- State health department and licensing personnel
- Federal officials concerned with health manpower needs

- Faculty members of colleges and allied health schools
- Representatives of various other concerned organizations

The testing programs described in the report are grouped in four sections:

- Tests in the medical laboratory field
- Tests in other health fields
- Tests in non-health fields
- Some non-test procedures for equivalency

For each test covered in the report, available information is included on the purpose for and methods used in its development, its format, content, and what it attempts to measure. A test's uses, candidates and their objectives, their relative success, what they have done with the results, and related procedures are also explored.

ABSTRACT

This report presents the results of the first part of a study designed to acquire information on relationships between educational achievement, national certification examination scores and job performance of medical technologists.

Participants in the study were selected at random from candidates filing for the July, 1962 certification examination and were then classified into 1 of 3 education groups.

The report compares the performance of the participants in four areas:

- Pre-clinical study
- Clinical study
- Certification examination
- The job

Conclusions of the study are presented in the following six areas:

- General
- Pre-clinical program
- Clinical program
- Certification examination
- Working environment
- Job performance ratings

Based on the information obtained during the study, recommadations were made in the following areas:

- Accreditation standards
- Pre-clinical education programs
- Clinical education programs
- Certification examinations

It was also recommended that further studies, incorporating site visits and interviews, be undertaken.

Bibliography: ___ pp.

ABSTRACT

This article describes two types of refresher training activities which were designed and implemented by a private hospital. The purpose of the training was to give medical technologists who have been out of active practice, the confidence and skills that they require to resume work in a laboratory. The two types of training provided were as follows:

- An evening survey course of 24 hours designed to stimulate the participants' confidence in their abilities to perform successfully
- Formal on-the-job training course of four months which included rotation through four sections of the laboratory

The articles describe the planning and conduct of the training activities, with particular emphasis on the survey course. The requirements for successful refresher courses are discussed in terms of the sponsor's experience. Such requirements include those for:

- Establishment of realistic program capacity
- Careful attention to scheduling
- Arrangements for instructors

The results achieved are also discussed in terms of the participants' reactions and employment as well as the sponsor. In summary, it was found that refresher training of either type described provides a means for promoting former medical technologists' return to active practice. The training should, however, be tailored to the needs of the participants as well as the sponsoring laboratory.

ABSTRACT

This article describes and critiques a method for evaluating a four-year baccalaureate curriculum in physical therapy. The methodology was developed and applied at the University of North Carolina to evaluate courses and extracurricular activities.

The article reports on the results obtained through 1970, including samples of the types of data collected on the tabulations made.

Surveys of graduates were identified as the most valuable source of information. The author suggests that graduates should be surveyed one year after graduation for maximum recall and response validity. The use of written questionnaires should be supplemented by interviews with a small sample of the graduates. In addition, students should evaluate their course on completion with the graduates focusing on the overall curriculum.

The article recommends that objectives be established at the beginning of the evaluation. The occurrence of unpredictable variables should be anticipated and provision made for taking them into account.

Means also should be provided for ongoing faculty and clinical educator participation in curriculum evaluation.

ABSTRACT

This article describes the development of an interprofessional approach to continuing education in the health sciences at the University of British Columbia. The description of the Division of Continuing Education in the Health Sciences focuses on:

- Member groups and facilities
- Organizational structure
- Interprofessional experiences and resulting beliefs, adaptations, and concrete outcomes

The process for developing interprofessional courses, courses with an interprofessional approach, and observations drawn from those experiences are outlined. In addition, a Mobile Instructional Resource Center for interprofessional continuing education is described in terms of:

- Its purpose of supplementing existing community programs to provide learning opportunities for health professionals living in small communities
- Participants and equipment

The following problems related to effective implementation are noted:

- Recruitment
- Schedule of fees and honorarium
- Conflicts in scheduling with unprofessional courses
- Promotion
- Design
- Instruction

Approaches to eliminating particular difficulties are also described.

ABSTRACT

This article describes a four phase program designed for improved selection, guidance, and training of occupational therapy students. Overall, the program was found to be effective on a short-terms basis. The goals, activities, and evaluation of the program and its phases during one year are presented. The sequential phases of the program denoted CTP included:

- Psychological evaluation consisting of personality testing and an interview with a clinical psychologists to provide guidance to students and faculty
- Field experience in a health care agency
- Life planning workshop to aid the participants in exploring their thoughts, feelings, and plans for the future
- Role playing session in which students acted as therapists and patients

The results of student evaluations of the program are presented for each phase. These results are interpreted statistically and in terms of students' comments. Administrative and staff reaction is indicated in the discussion of planned modification.

The following decisions were made regarding the four phases:

- The psychological phase will be maintained because it provides information useful to the staff and faculty
- The workshop will be dropped
- Despite student enthusiasm for the field experience, problems in operating this phase have postponed a final decision on its continuation
- The role playing phase is to be expanded as one component of a new course on the profession

ABSTRACT

This publication is the final report on a study of disabled hospital laboratory employees. The purpose of the study was to determine "how more disabled men and women can be attracted to the medical laboratory field, screened appropriately, and given the type of laboratory training suited to their particular limitations."

The four-year study was conducted through research studies, demonstration programs and implementation.

Results of an investigation of disabled persons presently employed in hospital laboratories are provided. Four areas were given primary emphasis during this investigation. These areas are:

- Type of disability
- Job assignments
- Performance records
- Problems of getting into the field

The disabled student was evaluated as to his ability to successfully complete laboratory training and function competently in the hospital laboratory.

The report's findings and conclusions support and encourage the recruitment, training, and utilization of disabled men and women in the hospital laboratory.

ABSTRACT

This paper discusses the elements surrounding the transition of multischool academic health centers to multi-institutional regionalized health education centers.

The author provides a brief analysis of the following:

- The reasons why such a transition is necessary
- The opportunities that such a transition will provide health educators
- The obstacles such a transition will produce
- The necessary requirements to be met in making the transition work

The paper also provides a "brief description of the consortium now being organized on Long Island under the aegis of the new Health Sciences Center of the State University of New York."

Also included in the paper is a discussion of the attitudinal and conceptual alterations that academic health centers must make in order to make the transit genuine and lasting.

ABSTRACT

This paper is concerned with proficiency examinations and their potential for allowing more effective utilization of existing manpower. The paper identifies some of the more important groups that proficiency examinations could remove career development barriers from. These are:

- Those who have received valuable training and experience while in the armed forces.
- Persons who have not obtained a degree in their field due to technical problems, such as the transfer of college credits, but who have substantially fulfilled degree requirements.
- Formerly certified professionals who are now inactive and who do not meet current requirements for credentialing.
- Persons performing satisfactorily in jobs which become subject to new requirements for credentials.
- Persons who obtain "extramural degrees" from accredited institutions of higher education which emphasize self-study or credit by examination.

The paper states that "proficiency examinations are intended to determine whether the individual meets job knowledge requirements." It goes on to describe the Division of Allied Health Manpower's position on the following aspects of proficiency examinations:

- Objectives
    - National credentialing system
    - Self-sustaining
    - Alternative to completion of an accredited educational program
    - Establish at entry-levels of an occupation
    - Promote a set of standards of proficiency
- Principles and Procedures

Also included is a brief examination of the present status of proficiency examinations. Included in this review are tests developed for:

- Physical therapy personnel
- Clinical laboratory personnel

Title: National Invitational Conference to Promote Collaborative Efforts for Health Manpower Preparation and Utilization: Summary Report

Principal Investigator(s): (Compilers)D. F. Peterson and E. E. Kerr

Sponsor: American Vocational Association and National Health Council

Publisher: Same as sponsor

Date: 1972

Place of Publication: Washington, D. C

Accession No.:

Availability: Sponsors

Contents:
Text: 18 pp.
Graphics: ___ pp.
Bibliography: ___ pp.

ABSTRACT

The participants of the conference identified a variety of situations or problems which were categorized into four broad areas:

- Politics and power
- Manpower data
- Role definition
- Preparation- utilization

Each area was then examined and discussed by:

- Identifying situations needing collaborative attention
- Recommending solutions for dealing with the problem
- Suggesting actions for implementing the recommendations

Time limitations prevented an in-depth discussion of each of the many situations.

The Committee unanimously adopted three resolutions:

- "That the National Health Council appoint an ad hoc Committee to explore the feasibility of creating a national health manpower study."

- The National Health Council should:
  - Promote the full scope of health careers
  - Emphasize the maldistribution of manpower
  - Encourage individuals to explore a variety of health occupations before making a career choice
  - Involve school counselors
- It is suggested that private and public, formal and informal professional and voluntary organizations implement corrective measures to assure broader representation of types of kinds of people.

ABSTRACT

This reprint of a memorial lecture presentation treats both curriculum planning and programmed instruction theoretically and operationally. Curriculum planning is first presented within an abstract framework of knowledge classification. Approaches to developing a workable curriculum are then discussed, as are the associated issues. Such issues include:

- Proper organization and sequencing of content
- Incorporation of related disciplines
- Professional and student participation

Curriculum evaluation is highlighted as a fundamental requirement. The needs for curriculum planning in the radiologic technology field are outlined.

A brief review of "programming for instruction" without the use of machines introduces the second topic. The different approaches to contemporary programmed instruction are described. The theoretical premises are defined for each kind of programmed instruction. The characteristics of each approach are described in terms of these premises and the manner in which each is developed and used in the learning process. Drawbacks of particular kinds of programmed instructions are noted. The article closes with an invitational challenge to the American Society of Radiologic Technologists to explore improved and expanded use of programmed instructor in improved curricula.

ABSTRACT

This report is a guide to the selection of clinical practice facilities on extended campuses. The guide is a modification and expansion of a similiar manual for associate degree nursing programs issued by the New York State Department of Education. This version focuses on educational preparation programs for 20 allied health occupations related to medicine, dentistry, and mental health. It was developed by a national panel as part of the Occupational Educational Project of the American Association of Community and Junior Colleges.

The guide explicitly recognizes differences in colleges, communities, health technologies, and health care agencies. It therefore outlines general considerations and procedures that will assist programs in selecting and working with clinical facilities.

Two major premises of the guide are:

- The need for clinical practice and field experience in an operational setting ranges from negligible to appreciable across health technologies.
- On-campus resources may provide a desirable alternative to reliance on health care agencies. The decision on use of clinical agencies should be based on detailed analysis of the curriculum and college resources.

> Selection and use of health care agencies as extended resources for health education are a demanding activity with many requirements. Constant attention to these requirements is crucial to effective programs.

The requirements and approaches to meeting them are presented in terms of five phases which make up the major sequential steps in the process of selecting and using clinical resources. Succeeding phases are dependent upon the successful dispatch of each preceding step, much as the initiation of the first step depends upon the college's satisfying itself that it is within its capabilities to engage in health technology education at all.

Phase I is a general discussion on factors to consider in determining the need for clinical facilities.

Phase II discusses the kinds of relationships that a collaborative educational endeavor requires, and seeks to examine the major issue affecting the selection of agencies--accord with the program objectives and philosophy as established by the college.

Phase III enumerates the clinical agency conditions and services required by health technology programs for students and faculty.

Phase IV discusses each participant's responsibility for supervision, instruction, and evaluation of students while they are in the extended campus facility.

Phase V stresses the importance of a written agreement or contract to which representatives of the college and clinical agency are cosignatories.

Some of the guide's specifics have been outdated by revisions in clinical education requirements, evolutions in technology, and developments within occupations. It remains, however, a useful reference in terms of the philosophy and general conditions that should govern selection and use of clinical facilities.

ABSTRACT

This article reports the results of a study of 538 college programs in medical technology. The study was based on a survey of the material available to interested students and analysis of critical parameters. The study findings are presented in a series of 14 tables and a narrative on implications.

Important summary findings include the following:

- Prevalence of differences and discrepancies in the content of the programs
- Existence of the potential for students from 56 percent of the programs to plan independently for the senior year of college work in a health care facility which has no formal agreement with their parent college
- Requirement by 18 per cent of the institutions for satisfactory completion of the Registry examination as a prerequisite requirement to graduation, apparently because these institutions find it necessary to have an evaluation of student capability in addition to that by the hospital faculty
- Failure of some outlined programs from the collegiate institutions to include sufficient total credits or specific courses in biology and chemistry to meet the current criteria of the Council on Medical Education and/or the Board of Registry

Integrated programs, although constituting a small fraction of the total surveyed (18%), appear to have fewer deficiencies than the more numerous 3+1 pattern programs. All of the integrated programs from which information was available have firm affiliations with hospital agencies, with 70 per cent utilizing only one facility.

The authors conclude that the obvious solution to problems noted"...is to terminate the sanction of open affiliation and to substitute firm contractual agreements with a limited number of clinical facilities."

ABSTRACT

The article provides a brief review of the allied health student's role as a worker and suggests ways for making this role more meaningful and beneficial for both the student and the patient.

The article is divided into four parts, as follows:

- The historical role of the allied health student in the health manpower crisis
- The pros and cons of student exploitation
- Internships for allied health workers
- Recommendations

The article provides some information needed in changing the focus of our present system of education in the health sciences and making it more responsive and relevant to students' needs.

The focus is on changing the method of program development.

Recommendations:

- Consideration should be given to dual appointments for faculty, college, and affiliating hospital.
- Students should be encouraged and helped in their efforts to live their own lives.

- Preventive medicine
- Teamwork approach to health care

The article is essentially a brief statement of new developments in the health field and a discussion of ways and methods of coping with them.

ABSTRACT

The primary purpose of the program described in this article is to provide for ties between small peripheral hospital laboratories and the personnel in large medical centers. Such centers have the resources to support the formal and informal continuing education which the smaller hospitals need. Both types of activities are included in the program described.

The formalized (continuing education) is provided by training centers which are strategically located hospital laboratories and blood banks selected by the program. These facilities were selected on the basis of their training potential. Medical Technologists who are usually teaching Supervisors provide the instruction. It is individualized to the needs of the volunteer trainees. Sessions have run from two to three days to three weeks. The emphasis is on personnel of small outlying hospitals. The trainee is reimbursed for all expenses; the training center is compensated on the basis of days of training provided. A three- and six-month followup are made to ascertain trainee perceptions of:

- Value of the program
- Practicality of the training received
- Caliber of the training center

The article also describes other continuing education support under the program such as the provision of current medical laboratory information extracts to the smaller hospitals. A generalized assessment of the formal education activity is also provided.

ABSTRACT

This article reports on a survey of occupational therapy faculty in 33 schools. Faculty was defined to include persons in academic and clinical settings although the article rarely differentiates. Descriptive data are presented on the types of preparation and areas of function of current faculty members. Forty-two percent of the faculty who functioned primarily as teachers also had clinic duties.

The article suggests that four resources be used in the development of more competent faculty. These resources include the graduate school, the hiring institution and the profession.

A major finding of the survey is that most occupational therapy educators "... have acquired their competency in higher education more by accident than by design." The article reports that a majority hold master's degrees. At the same time, the primary means of acquiring teaching knowledge, skill and attitudes were as follows:

- Trial and error
- Imitation of former teachers
- Attendance at workshops, institutes, etc. focusing on teaching

In discussing the resources for improved competency, professional skills and teaching processes are both emphasized with respect to graduate schools and the association. The Educator Development Plan of the AOPA is described as are the resulting publications. The responsibilities of employing institutions to provide for the development of teaching competencies also is stressed.

ABSTRACT

This study resulted in the identification of four levels of occupational therapy functions for which detailed job descriptions were developed. Curriculum guides were designed covering all levels and supported by details on the following:

- Interactive strategies and teaching methods
- Instructional media and resources
- Selection specifications for occupational therapy

In addition, a procedural manual for task analysis and curriculum guide development was prepared.

The data for the study were collected through a task analysis and job structuring procedure adapted from those used by the United States Department of Labor. The procedures included:

- Identification and assessment of the duties and tasks being performed in occupational therapy facilities. This was based on information collected by trained occupational analysts and occupational therapists from 12 selected facilities throughout the United States.

- Assessment of the list of duties and tasks; 63 occupational therapy educators and practitioners were selected to identify missing activities or delete non-relevant activities.

- Division of duties and tasks into job levels based on the educational and vocational level of training needs for each duty and task.

- Development of job descriptions for each job level. Supplementary surveys of practitioners, educators, and employers and health professions to confirm the feasibility and employability of the job descriptions.

- Development of performance objectives (similar to behavioral objectives except they do not specify criteria for assessment) for the duties and tasks in each level based on processes and products specified in each duty and task.

- Identification of content for each performance objective.

- Development of curriculum modules which include performance objectives, suggested teaching strategies, resources, evaluation procedures, and suggested content.

- Identification of module sequence within each level to faciliate concurrent and subsequent learning.

The curriculum guides are described as "...an aid and reference document for those people who are interested in designing an occupational therapy curriculum. The design may include anything from the development of a new course to the establishment of a totally new curriculum."

ABSTRACT

This paper discusses the growth of professionalism in the allied health field and the relationships of this professionalism with the medical profession.

The author outlines features which are common to all occupations generally accepted as professions:

- Skill based on theoretical knowledge
- Skill requiring both education and training
- Individual demonstration of competence through the passing of tests
- Emphasis on service for the public welfare
- An organization comprising its qualified members
- Integrity of conduct maintained by adherence to a code of ethics

Recognized programs of accreditation already exist in a number of allied health occupations, and reasons for continued growth are cited:

- Rapid expansion in knowledge and increase in technology requiring more education and training for adequate performance.

- Increased specialization in education and training and in application of the skills required.

- As the national population grows, a proportionate increase in the number of individuals engaged in the multiplying scores of health occupations results.

- The influence of the medical profession.

As the allied health professions increase, they will be prepared to function independently, therefore, the authors calls for the medical profession to give tangible recognition of its social responsibilities and obligations in its future relations with all, not just selected, health occupations.

The AMA has taken steps to reflect the need for changing attitudes toward the allied health occupations; these steps include;

- 1960--The Committee to Study the Relationships of Medicine with Allied Health Professions and Services, which led to

- The Commission to Coordinate Relationships of Medicine with Allied Health Professions and Services, which recommended the creation of

- The Council on Allied Health Professions and Services

It was recommended that the Council be concerned with:

- Identification and definition of existing and emerging groups now engaged in activities related to health care

- Identification and delineation of other areas in which persons who are not physicians may contribute to the total effort in health care

- Continual assessment of total manpower needs, its utilization, and updating of information in the allied health fields
- Cooperation with allied health professions in recruiting efforts when indicated

The author feels the Council on Allied Health Professions and Services should include in its membership members of various other health professions and the general public and should not restrict the membership only to physicians.

ABSTRACT

The SASHEP Commission report comprises three sections, described below. In addition, Staff Working Papers in two volumes present detailed discussions of various issues for consideration by the Commission.

Section One of the report is a summary of basic issues and problems related to the accreditation of educational programs in fifteen allied health professions. The basic issue is:

> "Professional education in these fields--which have become an increasingly vital component of the nation's health services--is being seriously encumbered by the costly maze of accreditation requirements and procedures imposed by the multiplicity of professional associations that characterize this important health manpower sector.
>
> The public interest requires that a means be found to promote collaboration between professional associations in allied health and educational institutions in these fields in an effort to create a new system of accreditation that will make possible a coherent, flexible, and rational approach to manpower development."*

Specific issues covered include accountability, structure, financing, expansion, research, and the relationship of accreditation to certification and licensure.

---

*Quigg Newton, President of The Commonwealth Fund.

Section Two contains a statement of basic policies for accreditation. These basic principles are considered necessary for the adoption of the recommendations of the Commission. They pertain to the purposes and function, operations, organization, monitoring, and financing of accreditation and the structure of accrediting agencies.

Conclusions and recommendations are contained in Section Three. The report discusses several alternatives as possible substitutes for the present system of allied health accreditation. The Commission concluded that specialized accreditation should be continued, but that fundamental changes in the present system are needed. In addition, policies for accreditation should be established by a national monitoring body.

The recommendations can be summarized as follows:

- The Association of Schools of Allied Health Professions, the Council on Medical Education of the American Medical Association, and the National Commission on Accrediting should jointly sponsor one or more meetings for representatives of all organizations directly concerned with the accreditation of allied health educational programs for the purpose of discussing and implementing the concepts and recommendations contained in this report.

- An independent, broadly representative organization, the Council on Accreditation for Allied Health Education, should be established to:
  - Provide a forum for the discussion of issues, problems, trends, and developments pertinent to allied health education
  - Serve as a forum for cooperative curricular analysis
  - Sponsor, coordinate, and supervise accreditation
  - Approve standards
  - Establish uniform policies and procedures

- Seek recognition from the national monitoring body

- The new Council should be comprised of:

  - Physicians
  - Allied health professionals
  - Educators
  - Representatives of institutional employers
  - Public representatives
  - Other health professionals
  - Representatives of the Federal Government

- Financial support for the Council on Accreditation for Allied Health Education should be borne primarily by the health professional associations and educational programs seeking to attain or maintain accredited status.

- The basic approach must be reoriented to include:

  - Providing for multidisciplinary site visit teams

  - Vesting additional responsibility for assuring the quality of clinical preparation in educational institutions

  - Requiring more rigorous procedures for the accreditation of independent hospital and laboratory training programs

Bibliography: ___ pp.

ABSTRACT

This article discusses a comparision of a conventional teacher mediated instruction and programmed self-instruction in learning and teaching red blood cell morphology. Brief descriptions are provided of the self-instructional unit, including behavorial objectives, and the study subjects. In total, 251 students (fourth-year medical technology, first year and evening community college, hematology laboratory trainees, and medical students) were selected and assigned to a control and an experimental group. The control group was instructed using the conventional approach; the experimental group used the programmed self-instructions. Both groups were tested before and after instructions.

The test and analysis methodology are outlined as an introduction to the results. The results are presented in five tables and narrative.

The following major conclusions were developed:

- The programmed self-instruction course was found to be more effective than conventional red cell morphology instruction for all students. Programmed instruction seemed to be particularly advantageous for the unsophisticated student.
- Instructor time required for students is greatly reduced when self-instructional programs are used.
- Programmed self-instruction allows students to progress at their own pace.

- Programmed self-instruction is equally suitable for use with sophisticated and unsophisticated or disadvantaged students, although sophisticated students may achieve a somewhat higher final level of proficiency.

Savings in instructor time were particularly pronounced in the case of small groups. Students in both groups spent equivalent amounts of time.

ABSTRACT

This paper presents the author's views on credentialing and competency and their relationship to career mobility.

The paper discusses the idea that most credentialing as it exists today does not serve as an effective measurement of competency. The type of examinations now being used are also questioned as to their appropriateness to measure those things that really measure competency.

Other topics discussed in their relationship to competency include:

- Curriculum
- Establishment of performance standards
- Current licensure vs. current competency
- Challenge exams

Bibliography: ___ pp.

ABSTRACT

Although extremely brief, Tomlinson and Wentling drive home the importance of an increased need for accountability among allied health educators in both clinical and didactic endeavors. Cited as an obstacle to effective determination and definition of accountability are the limitations imposed as a result of inadequate measures of student and staff performance. Tomlinson and Wentling believe that many current problems confronting allied health education could be resolved, if not eradicated, by clearly defining the objectives, roles and functions of individual educational clinical components and institutions. The article identifies the importance of striking a balance between the objective of the health care institution to provide low cost, quality care to patients and providing the opportunity for meaningful learning experiences for students. Wentling and Tomlinson suggest that the complex nature of clinical education is in part due to the necessary interface between clinical and educational worlds.

The article includes an accountability matrix of components and relationships in health occupations education which attempts to show broad elements of accountability for groups involved in the educational process and specifically delineate who is accountable to whom, for what, as well as how accountability is actually discharged.

Title: Guidelines for Health Occupations Education Programs

Principal Investigator(s): R. M. Tomlinson, et.al.

Sponsor: DHEW, OE, Division of Vocational and Technical Education

Publisher: University of Illinois at Urbana-Champaign, College of Education

Date: June 71

Place of Publication: Urbana, Ill.

Accession No.:

Availability: DHEW, OE, Division of Vocational and Technical Education (DVTE)

Focus:

Contents:
Text: 40 pp.
Graphics: 1 pp.
Bibliography: 3 pp.

ABSTRACT

The focus of these Guidelines is on educational programs for those health occupations which typically require less than baccalaureate degree preparation. They are designed to acquaint those concerned with education with the health industry and the opportunities available for developing educational programs which will make positive contributions to fulfilling students' needs.

The Guidelines describe how social forces, technology, and the growth, needs, and changes in the health field influence the health industry and health workers. They also provide suggestions for developing a strong, consistent and coordinated approach to the preparation and utilization of health workers.

Means of identifying, developing, and utilizing resources specific to health occupations education, e.g. manpower, monies, and educational program, are presented. Descriptions of the federal-state-local relationships are also provided, as well as the identification of legislation applicable to this field.

The final two chapters deal with actions which may be taken by state and local educational units to develop comprehensive health occupations education programs. An outline of a comprehensive program is presented.

ABSTRACT

The purpose of this study is to determine the extent to which commonalities of knowledges exist in 12 Allied Health occupations, assuming that such commonalities can provide a partial base for curriculum planning and evaluation of training programs. Special emphasis is given to the elementary courses, because at that level most of the duplication occurs.

The study discusses the need to provide for upward mobility in Allied Health professions and emphasizes the point that common care curriculum would facilitate this career ladder concept.

Chapter II contains a brief review of other studies that relate directly to the commonality of knowledges in paramedical occupations.

Results support the hypothesis that certain cores of knowledge are commonly useful for effective work in 12 Allied Health occupations.

The study also discusses the different course groupings and their commonality and degree of applicability to the different Allied Health occupations.
